The Rollem Advantage DH

Rollem recently introduced the Rollem Advantage perforating, scoring and slitting machine for both offset and digital printers alike. Printers of all type are benefiting from the Advantages ability to perform the highest die-score quality on all paper and board materials regardless of the source of print. Especially in the digital markets where many of the new printing technologies rely on heat based fusing processes that reduce and eliminate moisture in the printed paper. This reduction of moisture renders the paper brittle and more difficult to fold without significant cracking.

The Rollem Advantage uses its unique 2-stage scoring process that graduates the score depth in 2 processes to enable a deeper yet less damaging score to the material. This deeper depth of score enables even the driest and most troublesome materials to be folded without folding damage.

Further, the Rollem Advantage has a guillotine quality cutting capability and any right angle folding machine can be run in-line creating a one-step in-line process that does the work of 3 separate machines. 100% accuracy even on highly disproportionate sheet sizes, dozens of perforating styles including micro-perf, infinite scoring depth control and many other features gives all printers, the Advantage.
